

Microinverters

Siemens Microinverters are designed to invert Solar energy created by 60 cell silicon modules.

Each module has its energy converted to AC power using a dedicated Microinverter. Each inverter is rated for 215W, and is offered with either MC-4 or Tyco type DC connectors.

Trunk and Drop Cable System

The all new Trunk and Drop system provides a fast and simple connection to AC wiring, and eliminates multiple balances of system components. Each inverter is equipped with either an MC-4 or Tyco connector (to match module output) and a Trunk and Drop connection.

Monitoring

The Envoy Ethernet gateway and Enlighten monitoring service give a real time, per module view of power output, up-time, efficiency and other important measures. Since the Enlighten system works at each panel, it is very easy to monitor and maintain modules, rather than having the limited view of overall production, which a string inversion system is restricted to. The Enlighten system is smart phone compatible, so all of these features are available on the go. Lifetime monitoring is included with the purchase price of the Envoy.
